

Enterprise Quality Management

Powered by  M.Toolbox

End-to-End enterprise quality management.

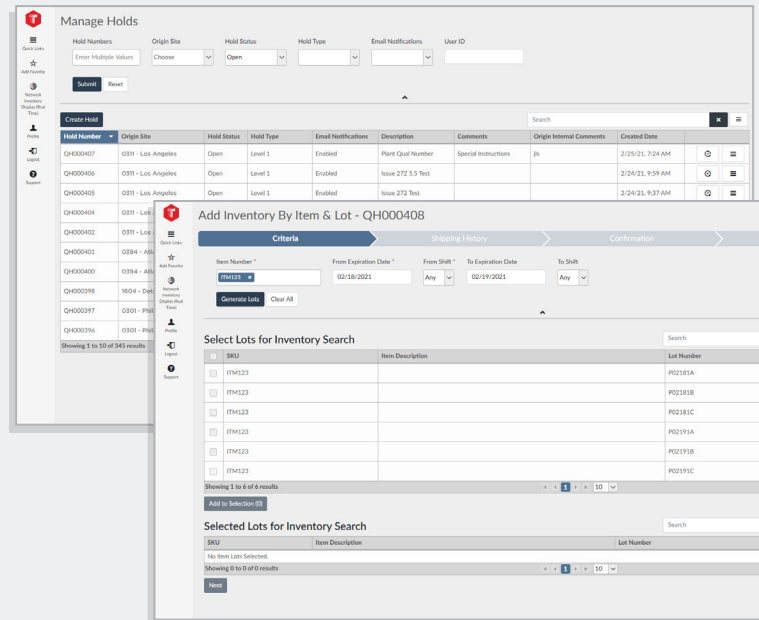

Eliminate manual communications and burdensome reporting requirements associated with managing quality events across complex distribution networks. With Enterprise Quality Management (EQM), achieve immediate containment of at-risk product across the network leveraging product genealogy and traceability, oversee real-time hold dispositioning, and deliver FDA-compliant reporting.

Protect your brand and maintain confidence in product quality.

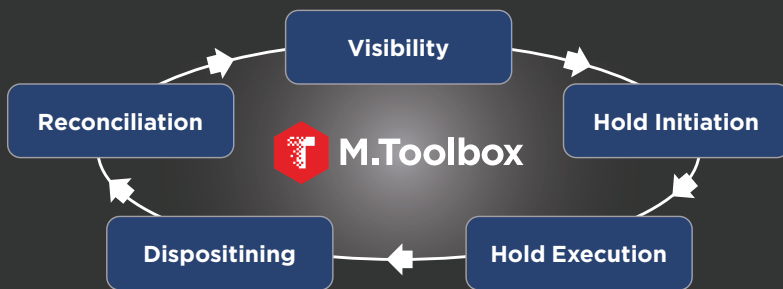

EQM provides advanced traceability of execution-level data, allowing quality containment to be more targeted than batch-level processes, while identifying customer shipments that have entered the channel, protecting revenue streams and reputation throughout any disruption.

EQM delivers immediate peace of mind with:

- ➔ Real-time, unit-level visibility of inventory genealogy and status enables identification and containment of at-risk product at the network level – whether in process, in-transit, or shipped.
- ➔ Support for lockdown and disposition of 3PL, co-packing, and co-manufacturer inventories.
- ➔ The ability to lock down impacted inventory by batch number, manufacturing date, or manufacturing line.
- ➔ Bi-directional workflow management of containment, dispositioning, and release/disposal including multiple and split outcome options across batches and locations.
- ➔ Confident and secure release of unaffected goods.
- ➔ Full audit visibility and elimination of duplicate systems for reporting quality issues to FDA and external parties.

Hold Number	Origin Site	Hold Status	Hold Type	Email Notifications	Description	Comments	Origin Internal Comments	Created Date
